# **AC771**

## Advanced Controller USER'S GUIDE

- Before using the device, please read the warnings below and this guide carefully. The
  accidents or damages resulting from not following the warnings included in this guide are
  under user's responsibility.
- This device is intended to be used by qualified personnel in industrial environments, do not use in houselike environments.
- Do not use the device at places where corrosive, flammable and explosive gases exist.
   Contact points may create electrical discharge and this may cause explosion or fire.
- Do not allow metal fragments or lead wire scraps or liquid matters to fall inside this device. Otherwise fire or electrical shock may happen.
- Take the neceessary precautions in order to prevent accidents and damages that may result in case the device gets faulty.
- There is no fuse or switch that brings the device in power down state, these should be added to the system by the user.
- Sensor and signalling cables should not be routed close to the power cables or inductive load cables.
- Do not power up the device before the connections related with the device are performed in accordance with connection diagram.
- Do not power up the device before the connections related with the device are performed in accordance with the connection diagram. While the device is powered, do not touch on the terminals.
- Configuration settings at factory out should be changed according to the user's preferences. The accidents and damages resulting from incorrect configuration settings are under users' responsibility.
- Never disassemble, repair and modify the device. These should be carried out by authorized service.

Model AC771 devices are modular devices that have been designed to measure and control different types of processes variables and all modules can be configured seperately. Complying international standards, reliability and user friendly usage features are the design principles of these devices. So that, they are ergonomic devices that can be used easily in many different industrial sectors.

- 2 Item 4 Digit LED Display
- 4 Item LED Indicator
- 1 Item Transmitter Power Supply (24Vdc)
- 1 Item Universal Sensor Input (TC, RT, mA, mV, V)
- 1 Item Auxiliary Analog Input (0/4-20mA)
- 3 Item Digital Input (15V)
- 1 Item RS485 Communication Unit
- 1 Item Analog Output (0/4-20mA, 0/2-10V)
- 2 Item Relay or Logic Output

ON/OFF, P. Pl. PD. PID Controls

100-240Vac Universal or 24Vac/dc Supply Voltage Isolation between Input/Output Modules

Proportional Valve Control without feedback
PID Heating/Cooling
Auto-Tuning (Automatic settings of PID parameters)
Automatic/Manual/Program Operating Modes
Bumpless Transfer Ability
Sensor Error Detection
Remote Set Point
8 Item Optional Set Point
Ramp Function
Retransmission (For Process and Set Vaues)
15 Different Relay Functions

Linear and Time Proportioning Control Output 100ms Sampling and Control Cycle

Standard MODBUS RTU Communication Protocol

Before using the device, please follow the instructions below according to the information in this guide.

- Model AC771 devices are modular devices, so that before using the device, control supply voltage and input/output modules if they are appropriate or not by the help of product code
- First of all, connect device to power supply and by using the configuration page, configure the device.
- After configurating the device, adjust set and hysterisis values of the relays which are selected as alarm in operator page.
- Power down the device and according to the connection diagram, apply other connections.
- Prepare the system which will be controlled to be run and power up the system and the device.
- If the control outputs of device will use PID and PID parameters are not entered manually, Run Auto-Tune in order to have the device to calculate these parameters automatically.
- In order to be sure that PID parameters are correct, use a new set value for device and observe the operation.
- Control all functions of the device by stepping through other operating modes.
- Finally, in order to prevent the unauthorized people to observe the system, make the neccesary operation for security by entering the configuration page and return to the Process Screen.

This user guide is prepared by following the instruction order above. How these operations are made are explained in detailed in related sections.

Diagram-1

| Module    | Explanation  |
|-----------|--|
| <b>S1</b> | Universal sensor input module (This sensor that is used to measure process value should be connected to the terminal which is identified with suitable symbols in this module).                    |
| S2        | 0/4-20mA Auxiliary analog input module (Function of this module is determined by "52.F" parameter that can be accessed from configuration page).   |
| LU        | Logic input module (Content of this module is determined by product code and the function of this module is determined by "LUF" parameter that can be accessed from configuration page).           |
| 01        | Analog Output Module (Content of this module is determined by product code and the function of this module is determined by "a UF" parameter that can be accessed from configuration page).        |
| R1,R2     | Relay Output Modules (Content of this module is determined by product code and the function of this module is determined by "r &F, r &F" parameters that can be accessed from configuration page). |
| PS        | Supply voltage input (Supply voltage is determined by product code).   |

Relay output modules can be identified as contact or logic output in product code. But in this user's guide, relay term is used to represent both.

#### **TECHNICAL SPECIFICATIONS**

| Power Supply (PS)              | 100-240Vac/dc:+%10-%15                           |                      |                            |                             |  |  |
|--------------------------------|--|----------------------|----------------------------|-----------------------------|--|--|
| Power Consumption              | 5W,8VA   |                      |                            |                             |  |  |
|                                | Thermocouple : B,E,J,K,L,N,R,S,T,U               |                      |                            |                             |  |  |

#### PROCESS-SCREEN:

Just after powering up the device, after showing program version for 2 seconds, "PV" display shows measured process value or error message and "ST" display shows the most used parameter depending to operation mode. This screen is called **Process-Screen**. During normal operations, this screen is used.

| 1 | PV DISPLAY | Process value or error messages are shown in Process-Screen, other screens show the parameter name.                           |
|---|------------|---|
| 2 | SP DISPLAY | In Process-Screen, this display's function is determined according to operation mode. Other screens show the parameter value. |
| 3 | R1 LED     | It indicates when "R1" relay is powered up.   |
| 4 | R2 LED     | It indicates when "R2" relay is powered up.   |
| 5 | MN LED     | It indicates when manual control is on.   |
| 6 | SN LED     | Not Used  |

|   | SYMBOLISATION OF ALPHABETICAL CHARACTERS |   |   |   |   |   |   |   |    |    |   |   |
|---|--|---|---|---|---|---|---|---|----|----|---|---|
| А | В  | С | D | Е | F | G | Н | I | J  | K  | L | M |
| R | Ь  | L | d | E | F | L | Н | ī | П  | ٢  | L | ī |
| N | 0  | Р | Q | R | S | Т | U | V | W  | Х  | Υ | Z |
| n | ۵  | P | 9 | _ | 5 | Ł | L | u | ונ | سم | 占 | Ē |

|        | ERROR MESSAGES                             |
|--------|--|
| Err. 1 | Sensor connection is broken at "S1" input. |
| Err.2  | Signal is broken at "S2" input.            |
|        | Process value is above the display scale.  |
|        | Process value is below the display scale.  |

|          | KEY FUNCTIONS  |
|----------|--|
| *        | While in Process-Screen, if it is pressed shortly, locked relays are resetted. Pressing for 5 seconds will change the operating mode. While in other screens, it is used to revert to the first page. Pressing for 2 seconds will activate the Process-Screen. |
| <b>≈</b> | It is used to change the parameter option or parameter value.  |
| <b>*</b> | It is used to change the parameter option or parameter value.  |
| Q        | In any page, pressing for a while activates the next parameter. While in Process-Screen, pressing for 5 seconds will start the Auto-Tune operation. For submit operations, it must be pressed for 2 seconds.   |

AC771 series include control devices that are designed for multi-purpose usage. So that they can be used in any environments that have appropriate input/output modules. These devices may work with different types of sensors and input signals and may control all outputs seperately. So that, before using AC771 device, input/output types and functions, control types and usage preferences should be determined carefully.

According to the product code, AC771 series devices may have 2 analog input, 3 logic input, 1 analog output and 2 relay output modules. Module types, functions and scales are determined with parameters which can be accessed in configuration page.

Furthermore, common parameters that determines the control type and operating mode, also necessary setting for control algorithm may be accessed in configuration page.

Before using an unconfigurated device, firstly power on the device and make configuration by following the instructions below:

#### Entering the configuration page and setting up parameters:

- ♦ In order to enter the configuration page, press "★" and "" keys simultaneously and continuously until "£.2" message appears in "PV" display when device is energized.
- ◆ Set the security code by pressing "≦" and "둘" keys by setting the value of "SP" display to configuration page security code when "£.2" message still appears in PV display (Default factory setting of this security code is "Д").
- If the security code is not valid when you have pressed "o" key, Process-Screen is to be reverted, otherwise first parameter of the configuration page is accessed.
- In parameter display, parameter name is displayed in "PV" display, preferences of the parameter setting is displayed in "SP" display.
- ♦ Now, you can access other configuration parameters in order by pressing "□ key .
- ◆ In order to change preferences of parameter setting, use "≦" and "둘" keys, in order to step to the next parameter use "⊡" key. A short time press of "☒" key makes you to access the start of page, a log time press makes you to return the Process-Screen.
- ♦ Below, you can find a graphical representation of these instructions in **Figure-3**.

Figure-3

Detailed information about configuration page parameters can be found in the next section.

Par. 01—F5

In order to restore the settings to the factory default, this parameter should be set to " $\alpha \sigma$ " and " $\bigcirc$ " key should be pressed for two seconds.

Setting Preferences: oFF, on

Par. 02— dP

It determines the decimal level (number of digits after dot) of all parameters which have a unit of "EU".

Setting Range : 0 - 3

**Warning:** When this parameter has been changed, all parameters which have a unit of "EU" should be set again.

**Note:** "EU", which is determined by "HU" parameter is a temperature unit for thermocouple or resistance thermometer measurements Otherwise, it is an engineering unit that represents the measured variable.

Par. 03—5 (£ £ [- ]

"S1" determines the sensor type which is connected to the universal sensor input. This sensor is used to measure the process value.

Setting Preferences: Table-1

| Table-1 | No | Concor Type                          |
|---------|----|--------------------------------------|
|         | NO | Sensor Type                          |
| F[-P    | 0  | Type-B Thermocouple (Pt%18Rh-Pt)     |
| FC-E    | 1  | Type-E Thermocouple (Cr-Const)       |
| FC-7    | 2  | Type-J Thermocouple (Fe-Const)       |

Unit : EU |  |  |

Par. 11 Setting Range: +199.9 - 999.9 Unit: EU

If the signal that is connected to "S2" auxiliary analog input module cannot be received, then it determines the scale value.

Setting Preferences: L (Low Value), H (High Value)

Par. 12— HL

It determines the temperature unit for the measurements of thermocouples or resistance thermometers.

Setting Preferences: °C (°C), °F (°F)

 While measuring with thermocouples or resistance thermometers, in order to correct measurement errors, it is added to measured value.

Setting Range : -100.0 - 100.0 Unit : EU

Par. 14— F & E 2.0

It determines the time constant of digital filter that is applied to analog inputs. If this value is increased, reading stability increases but reading speed decreases.

Setting Range: 0.1 - 10.0 Unit: sec

Par. 15— L UF

It determines the function of "LU" logic input module.

Setting Preferences: Table-3

| Table-3 | No | Logic Input Function                         |
|---------|----|--|
| oFF     | 0  | N/A  |
| 585     | 1  | It is used to select the set point remotely. |

Par. 16— o !.F

It determines the function of "O1" analog output module.

Setting Preferences: Table-4

| Table-4 | No | Analog Output Function               |
|---------|----|--------------------------------------|
| oFF     | 0  | N/A                                  |
| PCo     | 1  | Positive directed PID control ouput. |
| n[o     | 2  | Negative directed PID control ouput. |
| Put     | 3  | Process Transmitter                  |
| 5PE     | 4  | Set Point Transmitter                |

Par. 17— o (£ 4-20

It determines the type of "O1" analog output module.

Setting Preferences: Table-5

| Table-5 | No | Analog Output Type |
|---------|----|--------------------|
| 0- 20   | 0  | 0-20mA             |
| 20-0    | 1  | 20-0mA             |
| 4-20    | 2  | 4-20mA             |
| 20-4    | 3  | 20-4mA             |
| 0- 10   | 4  | 0-10V              |
| 10-0    | 5  | 10-0V              |
| 2- 10   | 6  | 2-10V              |
| 10-5    | 7  | 10-2V              |

**Note:** In order to be able to use the first four preferences, this module should be identified as being "0/4-20mA" in product code. As for the last four preferences, "0/2-10V" should be used as identifying code.

It determines the lower value of output scale when "O1" analog ouput module is used as a transmitter.

Setting Range: +99.9 - 999.9 Unit : EU

Par.19— o I,HL 800.0 It determines the upper value of output scale when "O1" analog ouput module is used as a transmitter.

Par. 28— r {F P[o

It determines the function of "R1" relay output module.

Setting Preferences : Table-6

| Table-6 | No | Relay Function                       |        |                       |         |  |  |

| Par. 46—H555         | Permission for changing the hysterisis ("אב") value by the operator.  |                         |  |  |  |  |  |
|                      | Setting Preferences: aFF(Off), an(On)   |                         |  |  |  |  |  |
|                      |   |                         |  |  |  |  |  |

| Par. 47— ĀĒ<br>oFF                          | Permission for changing the mode to Manual-Control.  Setting Preferences: aFF(Off), an(On)   |
|---|--|
| Par. 48— RC                                 | Permission for changing the mode to Automatic-Control.  Setting Preferences: pFF(Off), pn(On)  |
| Par. 49———————————————————————————————————— | Permission for starting the Auto-Tune operation.  Setting Preferences: aFF(Off), an(On)  |
| Par. 50— CoP<br>oFF                         | It determines the " $\Gamma \alpha L$ " parameter is shown or not which represents the PID control output level in operator page.  Setting Preferences: $\alpha FF(Off)$ , $\alpha \alpha(On)$ |
| Par. 51— Ar L                               | While in operator parameters, it determines the automatic return time to Process-Screen.  Setting Range: aFF(Off), 1-25  Unit: sec   |
| Par. 52—5 <i>E.2</i>                        | It determines the security code for Configuration page.  |

Setting Range : +999 - 9999

Existing configuration determines which parameters will be used in operator page and only neccesary parameters are displayed. These parameters which are determined in configuration are used in normal operation conditions. So, While in Process Screen, by pressing key "a" key, user can access these parameters in any time and by pressing the "s" key, user returns to Process-Screen again. Setting permission of the changeable parameters can be set with the related parameters in configuration page. While in any parameter in operator page, if user does not press any key, Process-Level is to be returned after the time which is determined by "Ar L" parameter, pass.

Detailed information about operator page parameters can be found in the next section.

Unit: EU

| Pu. 1       | It displays the data incoming from "S1" universal sensor in make this parameter visible, "52F" or "53F" parameter selected as "RPu" or "5Pu". |                |
|-------------|---|----------------|
| Pu.2<br>0.0 | It displays the data incoming from "S2" auxiliary analog in make this parameter visible, "52F" parameter should "#Pu" or "5Pu".               |                |
| PSP         | It shows the instantaneous set value.   |                |
| 8.8         |   | Unit : EU      |
| CoL<br>0.0  | It displays the level of PID control output. In order to make visible, "£oP" parameter which is in configuration page sho as being "oo".      |                |
| PuP<br>0.0  | It shows the position of proportional valve. In order to make visible, "b2F" or "b3F" parameters should be selected as configuration page.    |                |
| 55P.1       | It determines the 1th optional set value. In order to make visible, "L UF" parameter should be selected as being "シウム                         |                |
| 8.8         | Setting Range : [5PLL] - [5PHL]   | Unit : EU      |
| :           | :   |                |
| 55P.8       | It determines the 8th optional set value. In order to make visible, "L UF" parameter should be selected as being "5P5                         |                |
| <u> </u>    | Setting Range : [5PLL] - [5PHL]   | Unit : EU      |
| 5EŁ. 1      | It determines the set value of "R1" module. In order to make visible, "r iF" parameter should be selected as ALARM.                           | this parameter |
| 11.11       | Setting Range : [5PLL] - [5PHL]   | Unit : EU      |
| 5EE.2       | It determines the set value of "R2" module. In order to make visible, "¬2F" parameter should be selected as ALARM.                            | this parameter |

Setting Range : [5PLL] - [5PHL]

| } | 132   | It determines the control hysterisis value. In order to make this parameter visible, one of the proportional band should be selected as being "aFF". |           |  |  |  |  |
|---|---|--|-----------|--|--|--|--|
|   | <u> </u>  | Setting Range : 0. I - IDO.0   | Unit : EU |  |  |  |  |
| } | 135. 1  | It determines the hysterisis value of "R1" module. In order to make this parameter visible, "r !F" parameter should be selected as being ALARM.      |           |  |  |  |  |
|   | <u>[].</u> {  | Setting Range : LEC(Locked) , D. I - IDDD  | Unit : EU |  |  |  |  |
| } | It determines the hysterisis value of "R2" module. In order to parameter visible, "r2F" parameter should be selected as being |  |           |  |  |  |  |
|   | ii. i   | Setting Range : LEE(Locked) , D. I - IDD.D   | Unit : EU |  |  |  |  |

While configuring model AC771 devices, if PID parameters (PoPb, noPb, LE, dE, LP) are default factory parameters, control outputs operate in ON/OFF mode. In order to begin operating with PID parameters, these parameters should be determined manually or Auto-Tune operation should be done.

Because every process has different characteristics, PID parameters should be different too. Auto-Tune operation calculates the optimum PID parameters and saves them.

Before starting to operate Auto-Tune operation, "RŁbP" and "RŁHr" parameters should be set and "RŁ" parameter should be "ar". If "RŁbP" parameter is "aFF", Auto-Tune operates by using the set value at that time. In order to get the optimum PID parameters, selected set value should be at about the middle of process' whole power.

After having appropriate settings, while in Process-Screen, press the "¬" key for 5 seconds to start the Auto-Tune operation then "¬¬" message flashes in "ST" display. In order to have correct results, nobody should interfere with the system. While in Auto-Tune operation, the device calculates and saves new PID parameters after doing ON/OFF control for 2 or 3 oscillations with the determined set value and hysterisis. After finishing the Auto-Tune operation, "¬¬¬E" message in display disappears and the device begins to control the system (process) using the new PID parameters. After finishing the Auto-Tune operation, "¬¬E" parameter in configuration page should be changed to "¬¬FF" state again. While in the Auto-Tune state pressing the "¬¬E" key cancels the operation.

If user wants a device to operate in ON/OFF mode instead of PID, PID parameters should be set to default factory output.

Model AC771 devices can operate in two different modes. These are Automatic-Control mode and Manual-Control mode. While in Process-Screen, by pressing the " $\mathbb{R}$ " key for 5 seconds, modes can be changed. The function of "SP" display in Process-Screen is changes as explained below.

Unintended operating mode can be closed by using "RE" and " $\bar{h}E$ " parameters in configuration page.

Determination of remote set point can be done in two different methods while using model AC771 devices. These methods are described seperately below:

#### Determining Set Point by Using Auxiliary Analog Input (Remote Set Point):

"52F" parameter that can be accessed in configuration page should be selected as being "r 5P" and by using the "52LL", "52HL" parameters, a scale value should be selected.

#### <u>Determining Set Point by Using Logic Input Module (Remote Set Point):</u>

 $There \ are \ 3 \ logic \ input \ in \ ``LU" \ input \ module \ in \ these \ devices. These \ inputs \ are \ in \ P1, P2, P3 \ in \ order.$ 

If "LUF" parameter which can be accessed from configuration page is selected as "5P.", then 8 set values are shown as being "5P. 4-5P.8" in operator page. These are optional set values and according to signal that is received from P1,P2,P3 inputs, by using the table below they are selected as control set values. In automatic mode, selected set value is displayed in SP display and is used as control set value.

If optional set values and remote set value are used in to gether, remote set value is added to 1th optional set point.

| P1 | P2 | P3 | Code           | Explanation            |
|----|----|----|----------------|------------------------|
| 0  | 0  | 0  | 55P. I         | 1th Optional Set Value |
| 1  | 0  | 0  | 55 <i>P.</i> 2 | 2th Optional Set Value |
| 0  | 1  | 0  | 55 <i>P.</i> 3 | 3th Optional Set Value |
| 1  | 1  | 0  | 55P.4          | 4th Optional Set Value |
| 0  | 0  | 1  | 55P.5          | 5th Optional Set Value |
| 1  | 0  | 1  | 55 <i>P.</i> 6 | 6th Optional Set Value |
| 0  | 1  | 1  | 55P.7          | 7th Optional Set Value |
| 1  | 1  | 1  | 55 <i>P.</i> 8 | 8th Optional Set Value |

**Note:** "1"s in table states that the input is energized and "0"s states that input is not energized. Inputs are energized by connecting the VS+ point to the related input.

Model AC771 devices have an ability to control proportional motor valve without feedback. Valve control without feedback is also called Floating-Control.

In order to be able to control motorized valve, one of the relays of device should be used to move the valve in the open direction and the function of this relay should be selected as being " ${}^{\alpha}P^{\alpha}$ ". Other relay should be used to move the valve in the close direction and the function of this relay should be " ${}^{\mu}L^{\nu}L^{\nu}$ ".

In order to be able to control the proportional valve without feedback, the time pass should be measured from the open position to the close position and it should be entered into the "uŁŁ" parameter in configuration page.

Motor position is controlled with PID output. So, PID parameters must be determined. If PID parameters are not determined manually, in order to let the device determine the parameters automatically, Auto-Tune operation should be done.

 $Below, you \ can find \ a \ simple \ connection \ diagram \ for \ motorized \ valve \ control \ without \ feedback.$ 

**Proportional Motorized Valve Control** 

This devices are designed to be communicated in slave mode with MODBUS RTU protocol. All parameters and registers can be accessed with this communication type. Parameters can be read or can be set to a value.

Serial communication is established with Half-Dublex RS485 line. 32 devices can be connected to one RS485 line.

The cable which is used in communication line should be a data cable that is compatible with Half-Dublex RS485 communication and this cable should be connected parallel to all devices as a single line. Both cable ends should be terminated with a appropriate resistance. A communication line which is appropriate for 9600 Bps data tranmission speed can be up to 1000m.

Each device on serial communication line should have an unique address between 1 and 255 but all devices in this line should have same speed and parity type. Communication address, speed and parity type of these devices are determined with " Rddr, bRUd ve Prty" parameters which are in configuration page.

Below, you can find information about functions which are supported by MODBUS RTU, parameter addresses and others in tables.

#### Supported Standard MODBUS RTU Functions:

Function 01 = Read Coils

Function 03 = Read Holding Registers

Function 05 = Write Single Coil

Function 06 = Write Single Register

Function 16 = Write Multiple Registers

BIT Type Parameters (COILS)

| Address | Explanation ( 1 / 0 )          | Set Perm. |
|---------|--------------------------------|-----------|
| 0       | Auto-Tune ( ON / OFF )         |           |
| 1       | "R1" relay module ( ON / OFF ) |           |
| 2       | "R2" relay module ( ON / OFF ) |           |
| 3       | "R3" relay module ( ON / OFF ) |           |
| 4       | "R4" relay module ( ON / OFF ) |           |
| 5       | ERR1 Error ( Yes / No )        | No        |
| 6       | ERR2 Error ( Yes / No )        | No        |
| 7       | ERR3 Error ( Yes / No )        | No        |
| 8       | General Error ( Yes / No )     | No        |

#### REGISTER Type Parameters ( REGISTERS)

| Addr. | Explanation                           | Setting Range |      | Mul.  | Unit | Set Perm. |
|-------|---------------------------------------|---------------|------|-------|------|-----------|
| 0     | Valid decimal point                   | 0             | 3    | 1     |      | No        |
| 1     | Measured process value                | -1999         | 9999 | 10^DP | EU   | No        |

| 31    | Reserved                        | -1999   | 9999  | 10^DP | EU    |           |
| 32    | Control hysterisis value        | 1       | 1000  | 10^DP | EU    |           |
| 33    | Hysterisis value of "R1" module | 0       | 1000  | 10^DP | EU    |           |
| 34    | Hysterisis value of "R2" module | 0       | 1000  | 10^DP | EU    |           |
| 35    | Reserved                        | 0       | 1000  | 10^DP | EU    |           |
| 36    | Reserved                        | 0       | 1000  | 10^DP | EU    |           |

Not: Please contact to producer firm for the communication information about other parameters

Before start to use the device, be sure these steps are done.

- Be sure that 5 L parameter is chosen suitable with the sensor type you want to use. (S1 Universal sensor input is in the page 15 table - 1)
- Be sure 5 LHL parameter is set to highest value by sensor scale of S1
- Be sure r IF, r 2F, r 3F, r 4F parameters are chosen suitable with the function of relay. (Relay output number is optional. It can be change by device model. Relay function table is in the page 19 and 20 table - 6)
- Be sure a tF parameter is set to suitable function of analog output you want to use. (Analog output number is optional. It can be change by device model. Analog output functions table is in the page 18 table - 4)
- Be sure a Lt parameter is chosen suitable with the current/voltage output type shown on the device label (Analog output number is optional. It can be change by device model. Analog output type table is in the page 18 table - 5)
- Be sure a LLL parameter is set to lowest value of analog output scale you want to use.(Analog output number is optional. It can be change by device model)

#### To make PID Controll;

- If you want to use Relay Output Module, be sure:
- r tF,r 2F,r 2F,r 4F parameters (the ones you want use in PID control) should set to suitable functions between P E a, P a F a F a F a F a F a F a options that choosen from relay functions table
  - If you want to use Analog Output Module, be sure:
- a tF parameter is set to proper function between PLa,nLa options that choosen from analog output function table.,

To make PID controll with your device, you can enter parameters manually or automatically.

If you know the characterise of system, you can enter manually these parameters:

Proportional band value of positive PID control output PaPb, Proportional band value of negative PID control output ρaPb, Integral time constant ΔŁ, Differential time constant ΔŁ, and Control period sampling time ΣP.

You can start Auto-Tune function and device will calculate PID controll parameters automatically.

#### To start Auto-Tune process ;

- ●Enter temperature value of process set point to RŁ♭P parameter. This value should be around mid points of process' full power .
- Enter hysteresis value of process set point to REHr parameter. This value arranges
  the sesitivity of Auto-Tune process.
- •Set RL parameter on.

When the device main screen, press "or" button for 5 seconds.

While Auto-Tune operation is working, device display shows blinking RE. This expression fades away when the Auto-Tune process is finished.

To cancel the Auto-Tune operation, press "\*" button while operation is running.
